## WHAT IS CLAIMED IS:

- 1. A building panel comprising at least two panel domains, wherein each panel domain has an essentially homogeneous compressive strength and an average compressive strength; wherein said panel:
  - (a) has at least two panel domains having different average compressive strengths;
  - (b) is essentially free of a combination of hollow and solid foam strands;
- and wherein, if said panel has at least two adjacent panel domains containing fibrous material with a fiber orientation, the fiber orientation of one panel domain is non-orthogonal to the fiber orientation of at least one adjacent panel domain.
  - 2. The panel of Claim 1, wherein at least two domains differ in average compressive strength by at least 5%.
  - 3. The panel of Claim 1, wherein at least one panel domain is a conformable panel domain that, when compressed, reduces at least one dimension of the panel thereby allowing insertion of the panel into a cavity; wherein the panel also has a compressive recovery that causes frictional retention of the panel within the cavity.
  - 4. The panel of Claim 1, wherein at least one panel domain is a conformable panel domain that allows the panel to reversibly bend from a planar to a non-planar configuration.
  - 5. The panel of Claim 1, wherein the panel has a primary face, a face opposing the primary face, a panel thickness, and a slit penetrating to a depth less than the panel thickness traverses the primary face or the face opposing the primary face.
  - 6. The panel of Claim 1, wherein the panel has alternating conformable and rigid panel domains.

- 7. The panel of Claim 1, wherein the panel has a perimeter and said perimeter comprises at least one conformable panel domain.
- 8. The panel of Claim 1, wherein the panel has a conformable panel domain along at least one edge.
  - 9. The panel of Claim 1, wherein the panel domains are bands.
  - 10. The panel of Claim 1, wherein the panel has at least one edge that comprises a tongue or groove profile.
- 11. The panel of Claim 1, wherein at least one panel domain is a polymeric foam.
  - 12. The panel of Claim 11, wherein each panel domain comprises a polymeric foam.
- 13. The panel of Claim 11, wherein the foam has an average cell diameter within a range of from 0.01 millimeters to 10 millimeters.
- 14. The panel of Claim 11, wherein the foam has a density of 5 kilograms per cubic meter or more and less than 100 kilograms per cubic meter.
- 15. The panel of Claim 11, wherein at least one panel domain has an open cell content of 5 percent or more, according to American Society for Testing and Materials method D2856-A.
- 16. The panel of Claim 1, wherein at least one panel domain comprises coalesced polymeric foam strands.
  - 17. The panel of Claim 16 wherein the coalesced polymeric foam strands comprise polypropylene.
  - 18. The panel of Claim 16, wherein at least one panel domain comprises coalesced polymeric foam strands having interstrand spaces.
  - 19. The panel of Claim 1, wherein the panel comprises coalesced polypropylene foam strands having an average cell

diameter within a range of from 0.01 millimeters to 10 millimeters, and having a density within a range of from 5 kilograms per cubic meter to 100 kilograms per cubic meter; wherein at least one panel domain has an open cell content of 5 percent or more, according to American society for Testing and Materials method D2856-A.

20. The panel of Claim 11, wherein the foam's average cell diameter is within a range of from 0.1 millimeters to 4 millimeters, the foam's density is within a range of from 5 kilograms per cubic meter to 50 kilograms per cubic meter, and wherein the foam has an open cell content of 50% or greater, according to American society for Testing and Materials method D2856-A.
